**HYDROLOGIC AND WATER-QUALITY INVESTIGATIONS RELATED TO
PLACER MINING IN INTERIOR ALASKA, SUMMER 1988**

By

Scott R. Ray

Alaska Division of
Geological and Geophysical Surveys

April 1989

THIS REPORT HAS NOT BEEN REVIEWED FOR
TECHNICAL CONTENT (EXCEPT AS NOTED IN
TEXT) OR FOR CONFORMITY TO THE
EDITORIAL STANDARDS OF DGGS.

794 University Avenue, Suite 200
Fairbanks, Alaska 99709-3645

Monitoring of interior Alaska streams affected by placer mining was continued during the 1988 field season by Alaska Division of Geological and Geophysical Surveys (DGGS) investigators. The study, which began in 1984, is a combined effort of the Alaska Departments of Environmental Conservation (ADEC) and Fish and Game (**ADF&G**). Results of the previous field seasons can be found in **Mack et al (1988)**, **Mack et al (1987)**, **Mack and Moorman (1987)**, and **Mack and Moorman (1986)**.

The 1988 summer field season plan was to maintain two automated sites on Birch Creek (at the Steese Highway bridge and above Twelve Mile Creek), one on Faith Creek (at Steese Highway bridge), and two on Goldstream Creek (at Ballaine Road and at Minto Flats). Turbidity, total suspended solids, and discharge (except at Goldstream Creek sites) were monitored at each site. Grab samples were collected from additional streams in the Birch Creek Drainage.

To ensure consistency of data between the different field seasons, the same sampling and analytical techniques were used during each field season. For details of the methods, see **Mack et al (1988)**.

RESULTS AND DISCUSSION

Appendix A contains the turbidity, total suspended solids, discharge, and sediment load data from the automated collection sites. Appendix B contains the turbidity and total suspended solids from the non-automated sites. The automated sites represent the average daily conditions, while the non-automated sites (grab samples) represent instantaneous conditions. Appendix C contains the daily discharge data from the automated sites.

Discharge

Table 1 summarizes the discharge data from the 1988 field season and previous field seasons. The 1988 season was much drier than the previous seasons with the flow at Birch Creek at the Bridge 43 percent less than the 1987 flow; Birch Creek above Twelve Mile Creek was 65 percent less, and Faith Creek was 29 percent less.

The average flow for Faith Creek and Birch Creek above Twelve Mile Creek during June is based on four days of data. The average monthly flow for these sites would probably be higher if we had data for the entire month, as greater flows existed earlier in the month from the spring runoff.

The flows during September, 1988 were similar to those previously measured during September. The largest deviations from previous years occurs during the summer months of June and July.

Table 1. Summary of discharge data (discharge values in cfs, area in mi²).

Site	Area (mi ²)	Jun	Jul	Aug	Sep	Ave
Birch at Bridge						
1988	2150	2490	1230	1300	1370	1430
1987		4120	2570	2380	1010	2520
1986		3730	2370	700	828	1910
1985		4600	1710	1930	3790	3010
Birch above 12 Mile						
1988	85.4	66.9	35.4	47.5	68.0	49.2
1987		196	147	149	74.8	142
1986		207	125	71.2	76.5	120
Faith Creek						
1988	61.0	81.8	46.1	91.3	93.9	70.6
1987		113	51.6	134	103	100
1986		107	80.4	141	149	123

Turbidity

Table 2 summarizes the monthly and seasonal turbidity averages and seasonal medians at the automated sites. Mack (1988) suggested that “the median may better represent the normally observed turbidity value and indicates the extent to which the average is affected by extreme events”. The median turbidity value has continued to fall each year at every site except Goldstream Creek at Minto. The average turbidity value decline was over 50 percent from 1987 values, with the smallest decline of 39 percent at Birch Creek above Twelve Mile Creek.

Table 2. Monthly and season average turbidity, and seasonal median turbidity All values are in NTUs.

Site	Jun	Jul	Aug	Sep	Ave	Median
Birch at Bridge						
1988	23	5.7	6.9	9.6	11	7.1
1987	72	31	24	12	38	18

Goldstream at Minto						
1988	39	13	23	---	25	19
1987	6.3	7.4	---		6.8	6.2

Sediment Load

Table 3 shows the monthly and seasonal sediment loads for the automated sites. The sediment loads in 1988 were much less than previously measured. This is probably a function of two factors; lower discharges and less sediment input from placer mining. The lower discharge translates to lower stream power, resulting in less sediment eroded from streambanks and disturbed areas. Since major events account for the majority of the annual natural sediment input (Ray and Maurer, 1989; Mack et al., 1988), the seasonal sediment load is less. The low turbidity values at low flow also indicates that there was less sediment input from placer mining than in previous years. These factors combined resulted in very low seasonal sediment loads.

Table 3. Average daily sediment load by month and season (tons/day).
